
Immunology and Etiology Of Type 1 Diabetes

Diane Wherrett

Division of Endocrinology

Hospital for Sick Children

University of Toronto

Overview

- **Current understanding of pathogenesis**
- **Genetics of type 1 diabetes**
- **Diabetes prediction**
- **Diabetes prevention**
- **Ethical issues**
- **Questions**

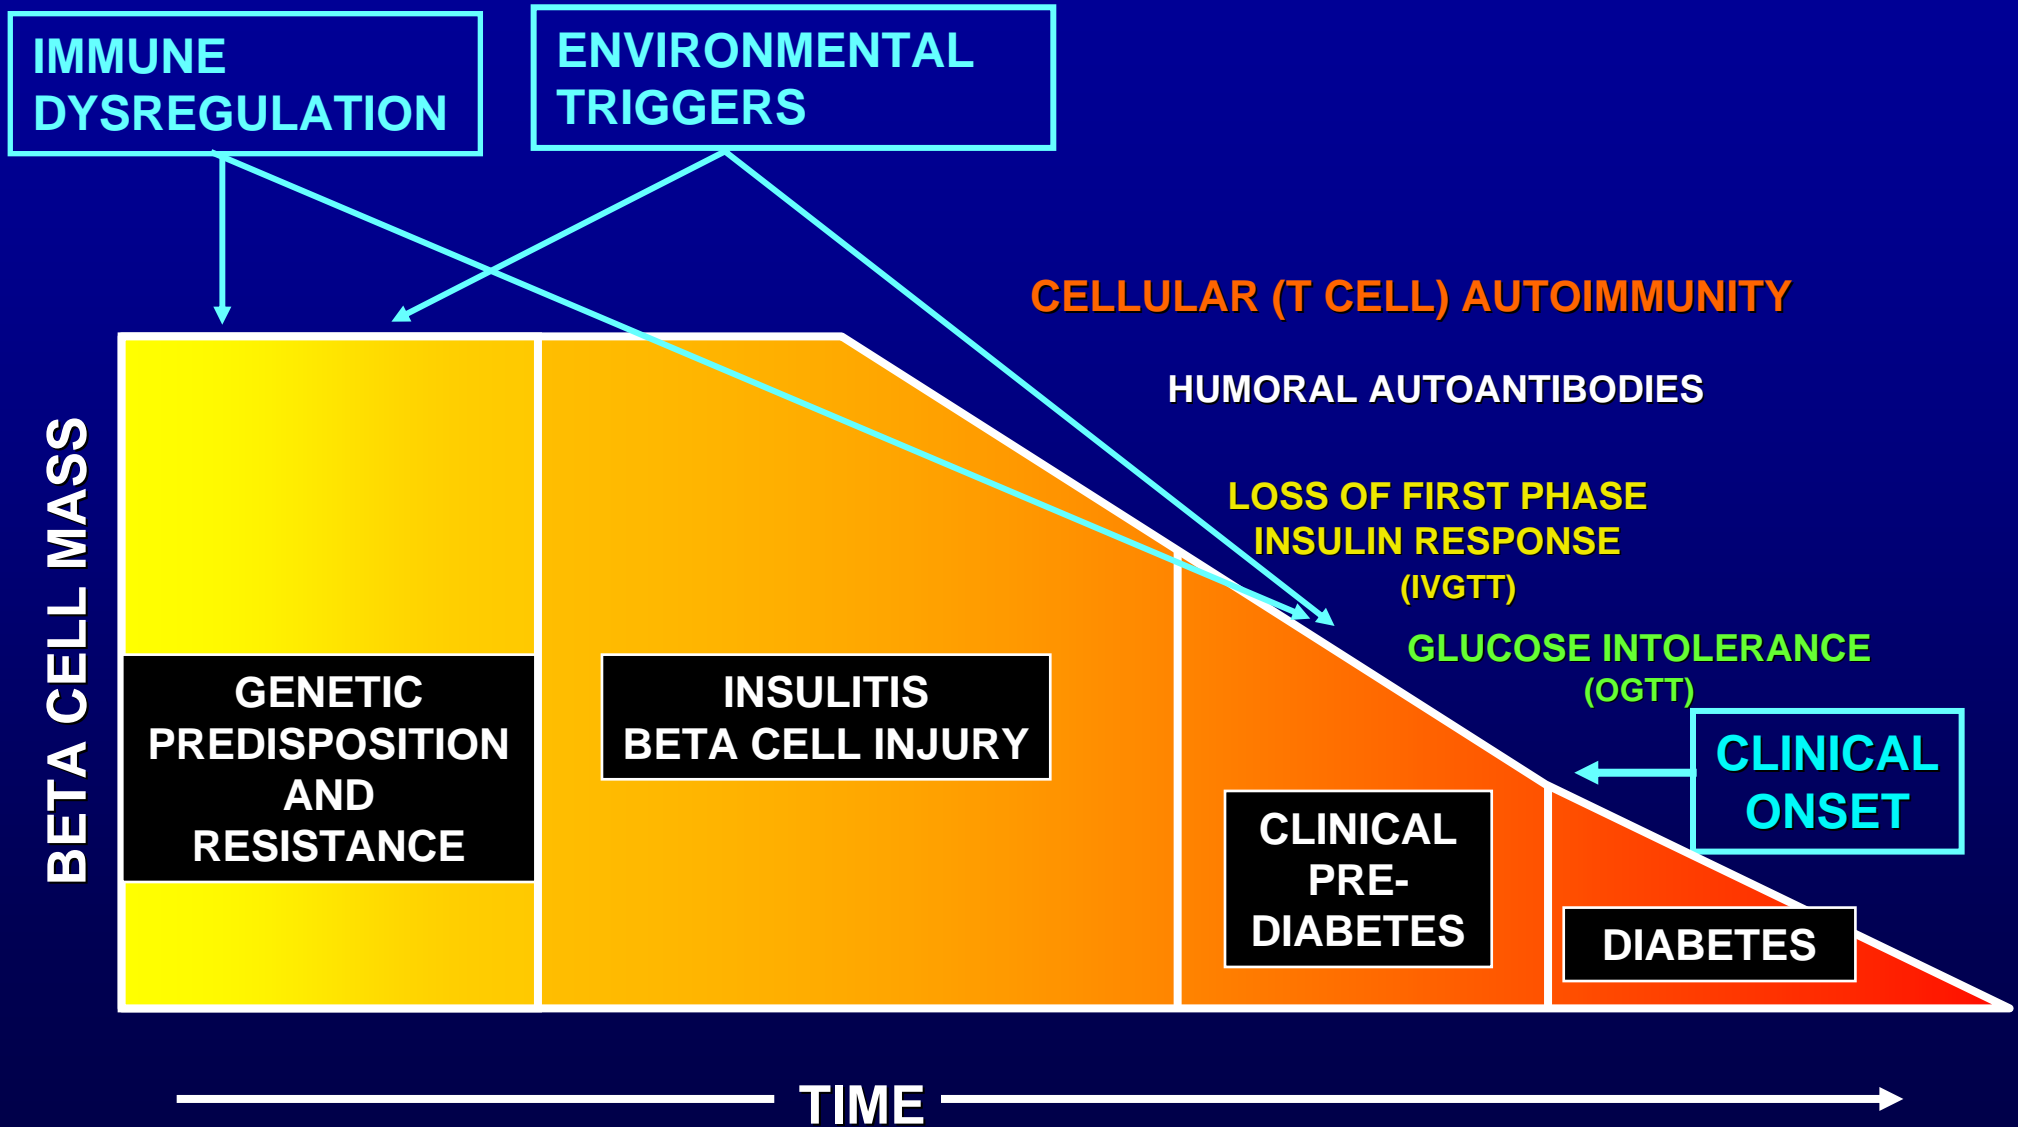

Type 1 Diabetes Pathogenesis

Type 1 Diabetes

- Autoimmune condition resulting in destruction of β cells of the pancreas
- Leads to life-long insulin requirement
- Peak age of onset prior to puberty, range 3 months to 50+ years
- Incidence 27/100,000 in those under 20 years of age in Ontario

Natural History of Type 1 Diabetes

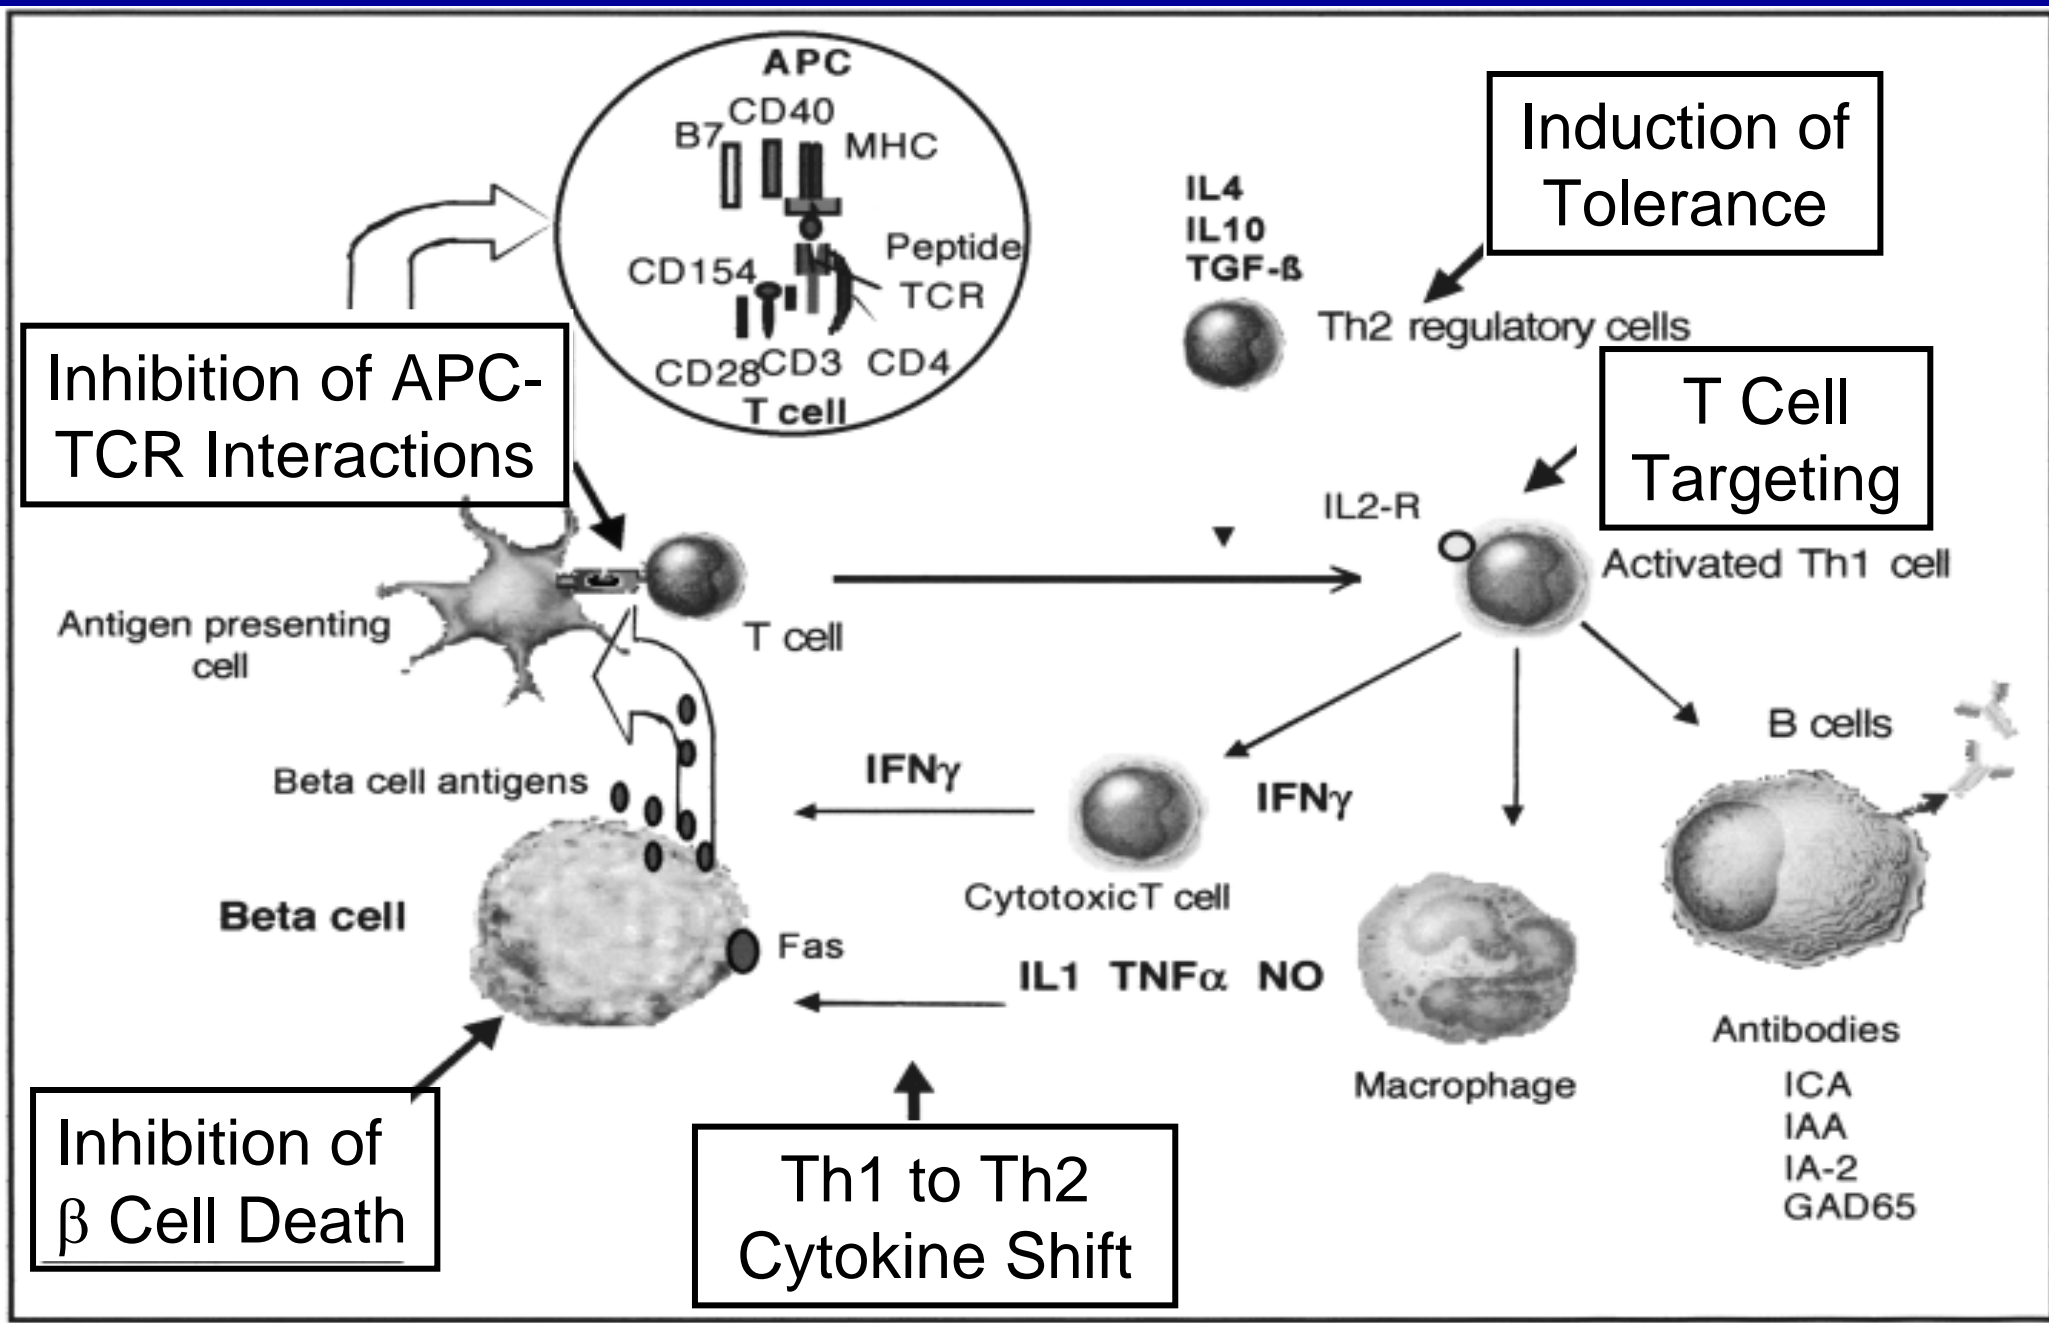

Immune Tolerance

- Immune system is “educated” to become tolerant of self and prevent autoimmunity
- Immature T cells die in the thymus if they bind too weakly or strongly to peptide-MHC
- Also occurs outside thymus

Genetics of Type 1 Diabetes

Familial Risk

Risk Group	Type 1 Diabetes
General Population	0.4%
Maternal Offspring	1 to 4%
Paternal Offspring	6 to 9%
Siblings	5 to 6%
Monozygotic Twins	33 to 50%

HLA Genetics

- **Sibling risk 15x greater than general population**
- **60% of risk explained by HLA**
- **96% of Canadian children with diabetes HLA DR3 &/or 4 (46% in population)**
- **Linked to nature of amino acid in DQ allele**

DQB1*0402

α -chain

β -chain

Other Genes

- **5' region of insulin gene**
- **CTLA-4 gene**
- **Linkage or association with 20 regions of the genome**
- **Same regions also found in other autoimmune diseases**
- **Not clinically useful at present**

Prediction of Diabetes

Prediction

- **Based on studies of first degree relatives**
- **Antibodies measured, often over many years with follow-up to diabetes**
- **First phase insulin secretion often assessed as a measure of β cell mass**

Islet Antibodies

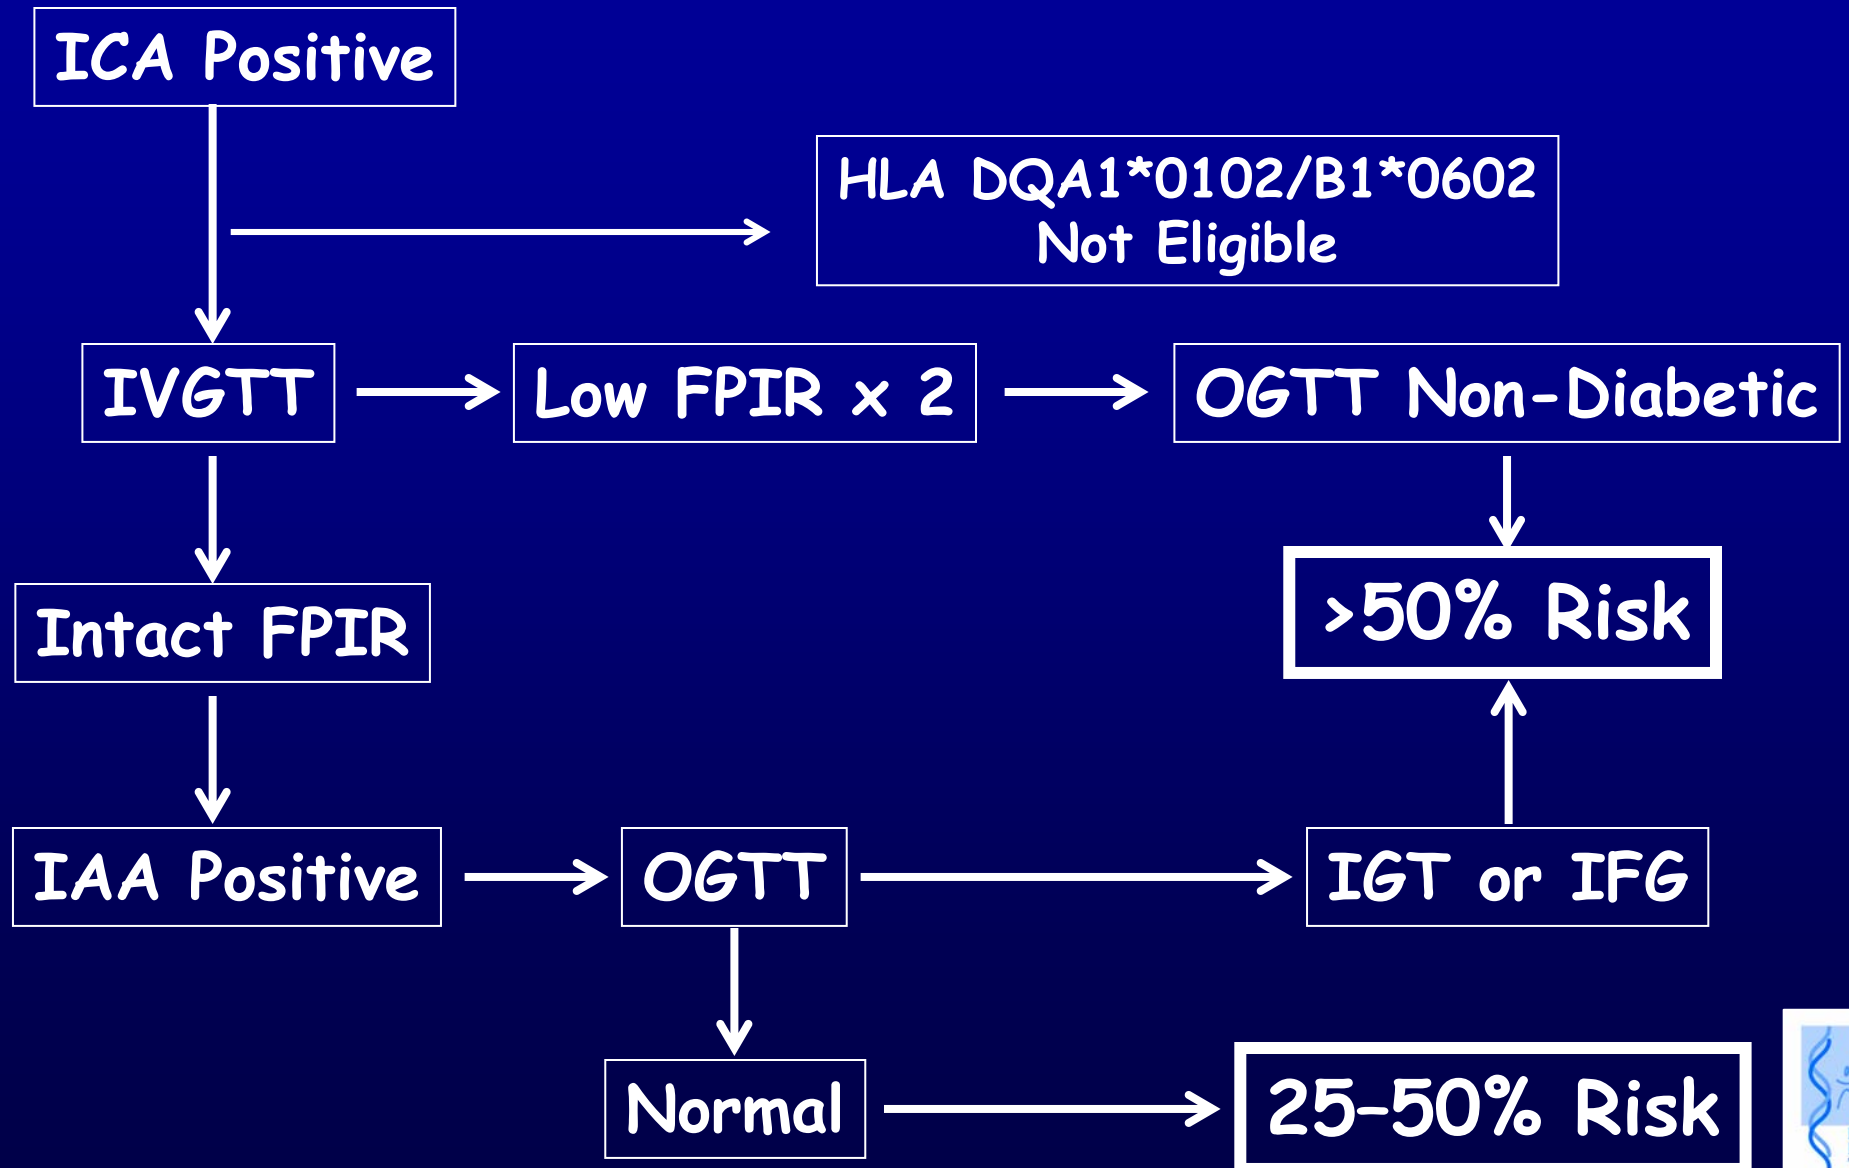

- ***GAD (glutamic acid decarboxylase)**
 - Enzyme in insulin processing
- ***IA-2 (ICA512)**
 - tyrosine phosphatase, “38 kD antigen”
- ***insulin - β cell specific**
- **Islet cell antibodies (ICA) – non-specific antibody**
- *** Can be easily measured and quantified**

Diabetes Prediction in 1993

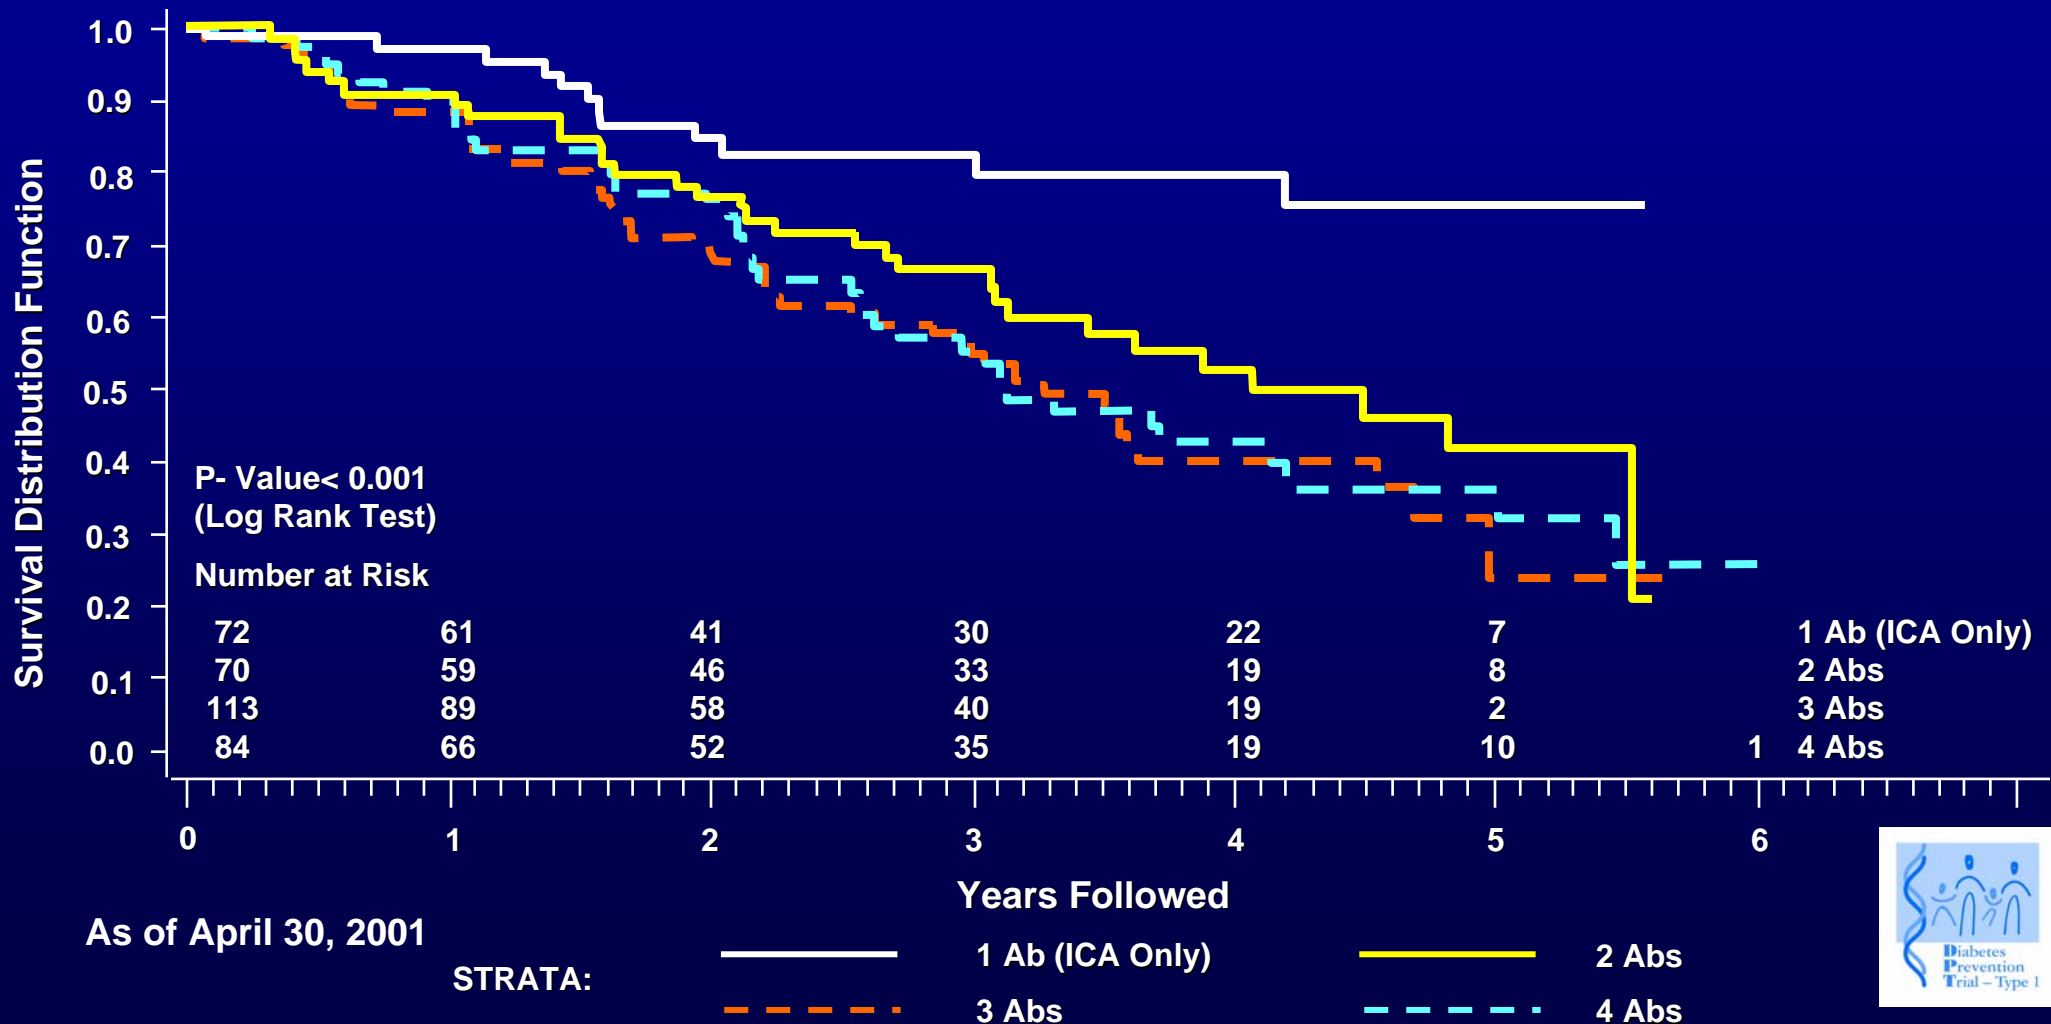

ICA >20 JDFU 37% risk	HLA	50-60%
	GAD	?
	37 kD	?
	IAA	>50%
	Low FPIR	>90%

Bingley, Diabetes 1993

DPT-1 Diabetes Prediction

DPT-1 Parenteral Study – Time to Diabetes By Number of Confirmed Antibodies

DPT-1 Parenteral Study – Time to Diabetes By Number of Confirmed Antibodies

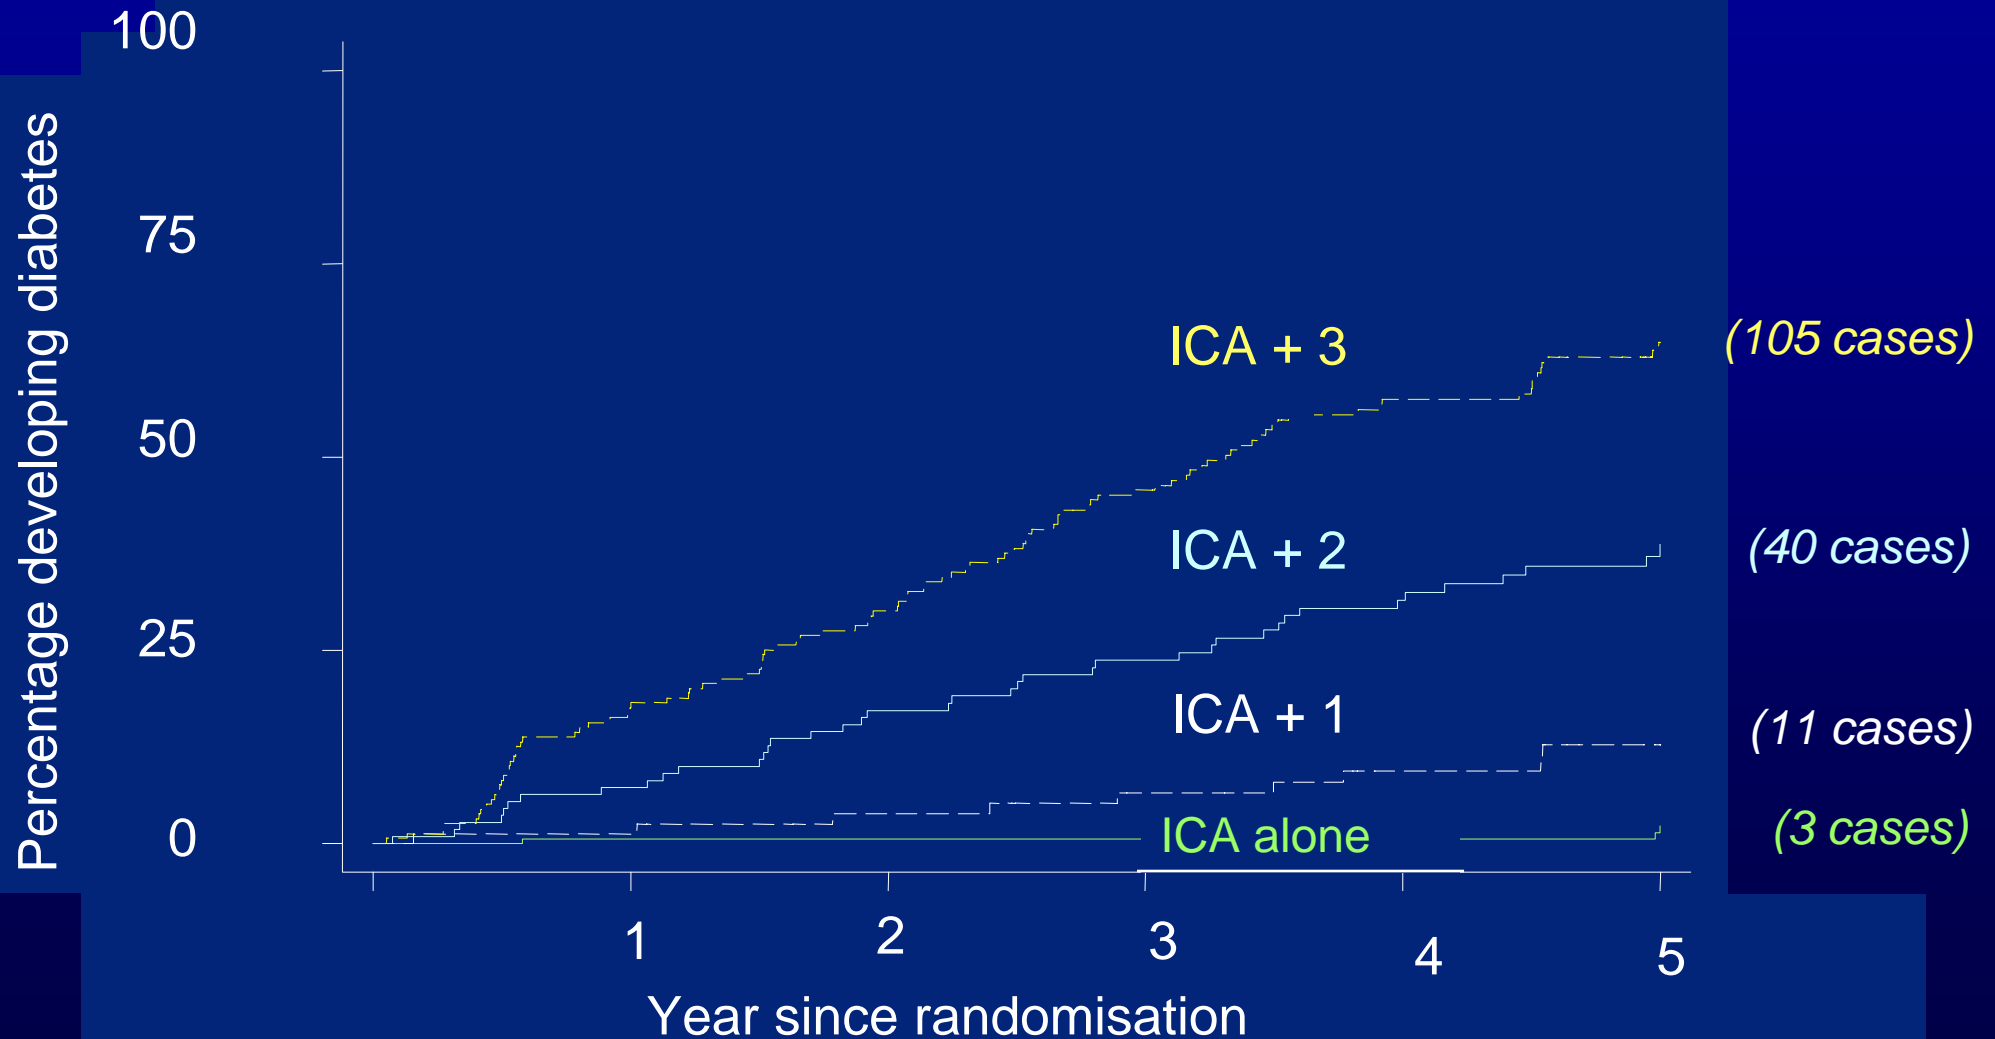

As of April 30, 2001

STRATA: — 1 Ab (ICA Only) — 2+ Abs

Progression by Number of Antibodies - ENDIT

Prediction: Bart's Oxford Family Study

Diabetes Prediction 2005

- Screen for GAD, IA-2, IAA in <10yrs, perhaps ICA in those with one antibody
- Continue to eliminate low risk HLA haplotype
- Can select degree of risk by numbers of antibodies/ titre
- IVGTT rarely needed

Diabetes Prevention

Types of Prevention Strategies

- **Primary – prevent immune response**
 - newborns
- **Secondary – prevent progression from autoimmunity to diabetes**
 - relatives
- **Tertiary – intervene at disease onset to prevent ongoing β cell loss**
 - new onset patients

Primary Prevention

Cow's Milk Formula & Diabetes

- **Animal model experiments suggest that weaning to hydrolyzed protein formula protects**
- **Human data variable, may be slight increase in risk with cow's milk formula introduction before 3 to 4 months (OR=1.61)**

Infant diet and beta-cell autoimmunity

Norris et al. DAISY 2000

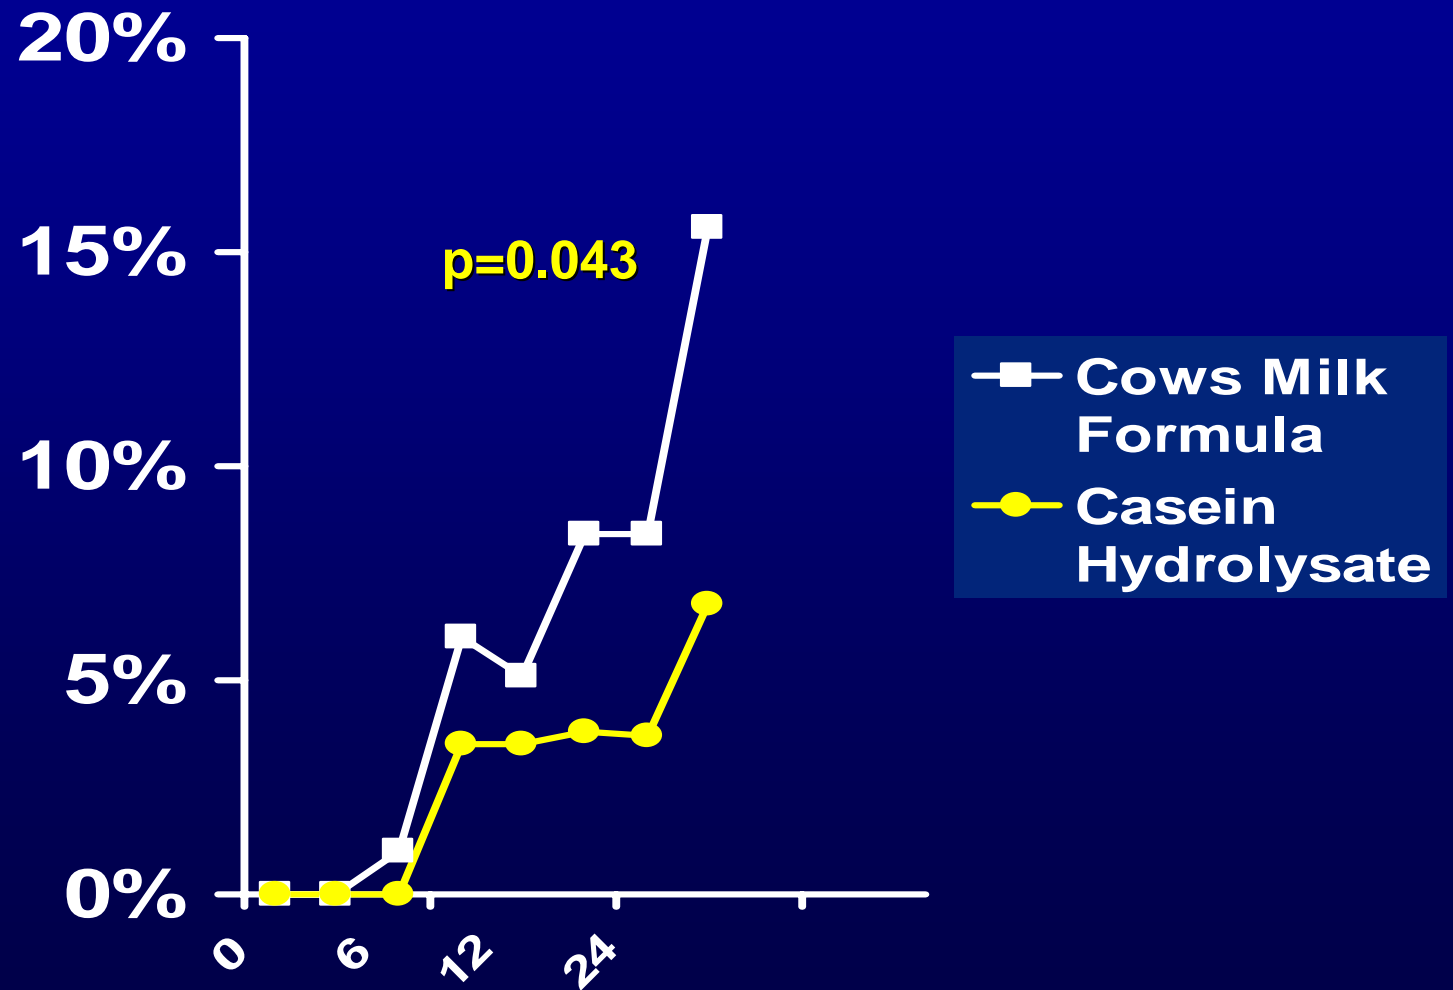

Hazard Ratio

Adjusted for HLA-DR,DQ and relationship to type 1 diabetic person

Pilot for TRIGR 3-yr Follow-up Results

Seroconversion to 1+ Autoantibody

n=173

TRIGR Trial

- International multicentre trial, 17 Canadian sites
- Infants with relative with T1DM and risk HLA alleles randomized to cow's milk or hydrolysed protein formula prior to 8 months of age
- Sample size 2370
- Endpoint - islet antibodies to 10 years of age

Diabetes and Vitamin D

Study	Question	Outcome
Europe Case-control	Retrospective Infant vit D	OR 0.65
Norway Case-control	Retrospective Cod liver oil in pregnancy	OR 0.36
Finland Cohort	Prospective Infant vit D	RR 0.12 with high dose

Secondary Prevention

Hurdles for Prevention Trials

- 1. Finding subjects**
- 2. Long duration of follow-up without surrogate markers of efficacy**
- 3. Need promising interventions & multicentre trial infrastructure**

Large Prevention Trials to Date

- **Diabetes Prevention Trial-Type 1 (DPT-1)**
 - Parenteral insulin in high risk (>50%), oral insulin in intermediate risk (25 to 50%)
- **European Nicotinamide Diabetes Intervention Trial (ENDIT)**
 - Nicotinamide or placebo in all at risk

DPT-1 Intervention Protocols

- **Parenteral Insulin**
In Subjects with 5 year Risk of
Type 1 Diabetes $> 50\%$
- **Oral Insulin**
In Subjects with 5 year Risk of
Type 1 Diabetes = 26-50%

Immunoregulation

**TH1
Cells**

**TH2
Cells**

**TH3
Cells**

IFN- γ , IL-2

***Destructive
Cytokines***

IL-4, IL-5, IL-10 TGF- β

***Protective
Cytokines***

DPT-1 Population

TARGET GROUP: NON-DIABETIC RELATIVES

- **First-Degree Relatives**
 - (Siblings, Parents, Children)
 - Age 3-45 years
- **Second & Third Degree Relatives**
 - (Cousins, Nieces, Nephews, Aunts, Uncles, Grandchildren)
 - Ages 3-20

***If ICA+ > 10 JDFU ---> STAGING**

II. Staging: Multiple Criteria

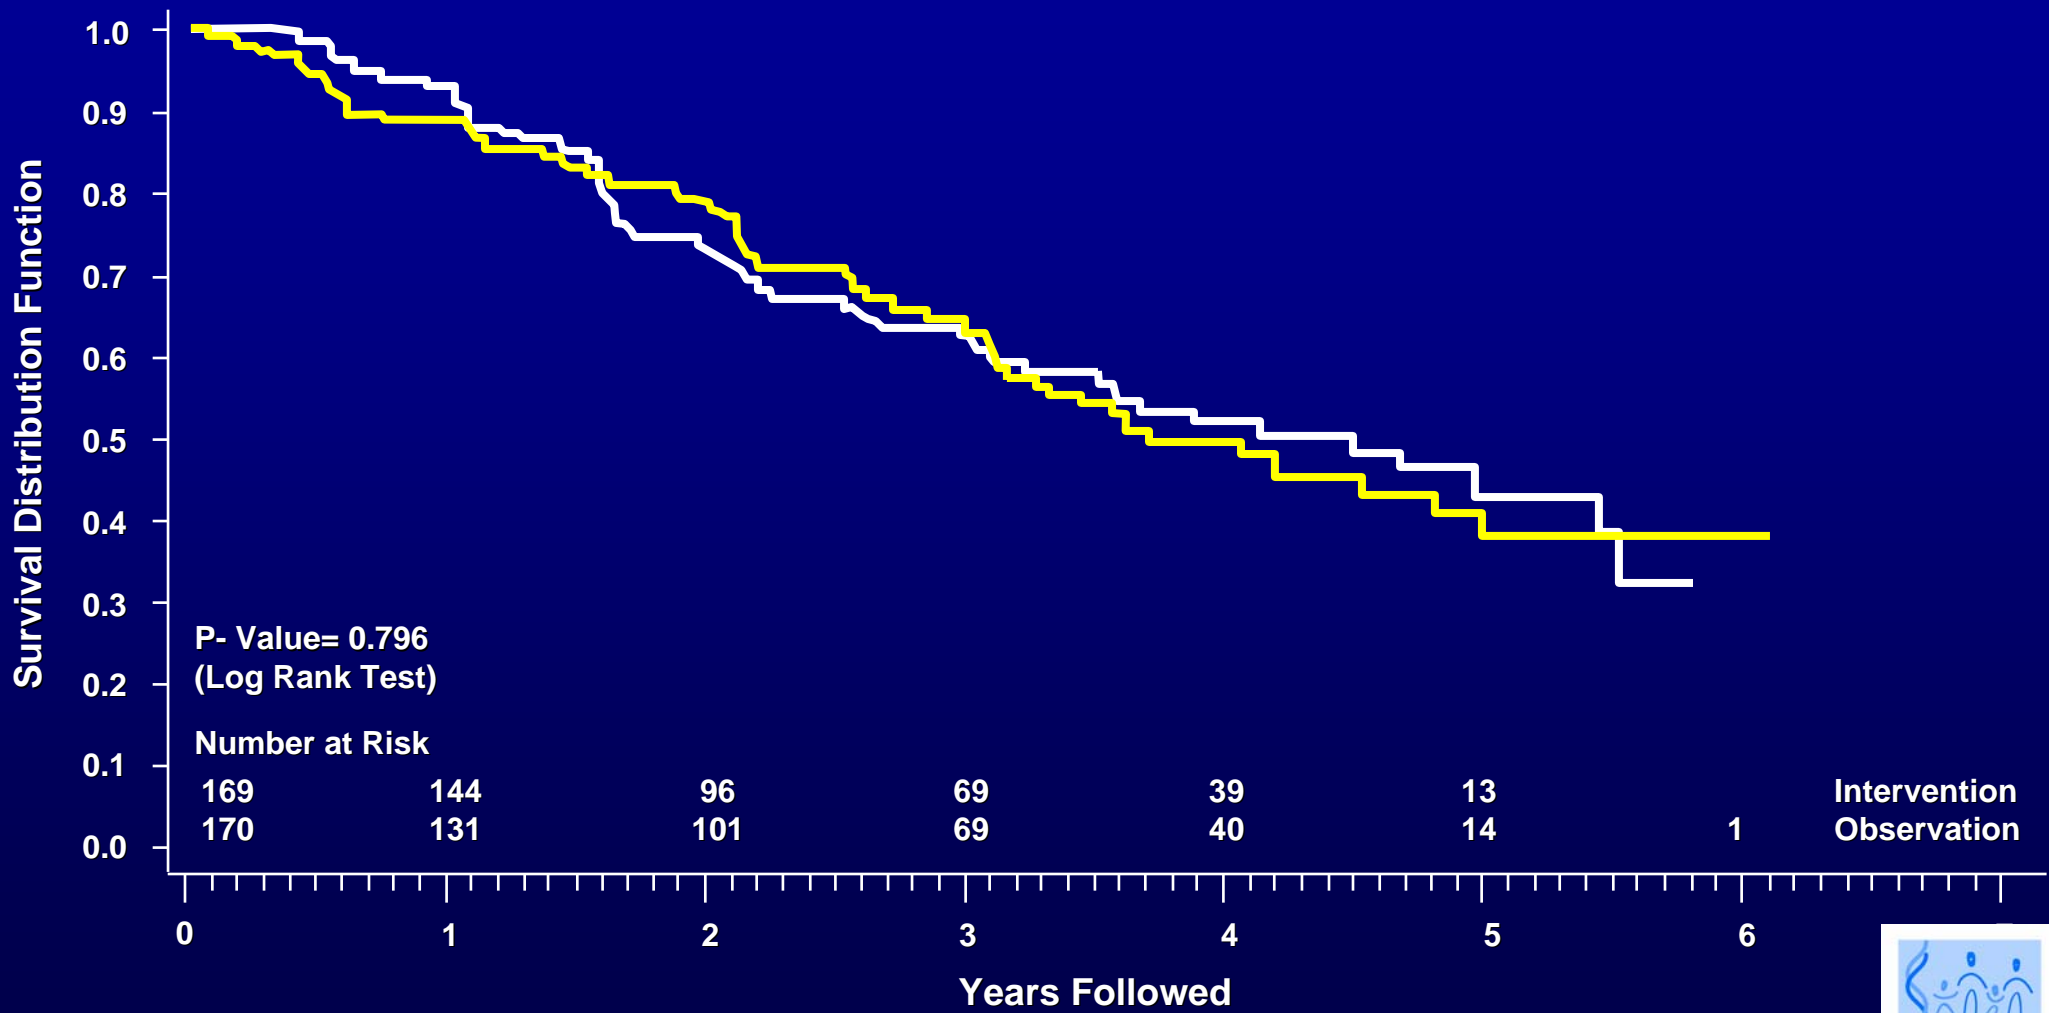

- **Genetic**
 - Protective HLA
- **Immunologic**
 - ICA, IAA, **GAD65 Ab, ICA-512 Ab**
- **Metabolic**
 - IVGTT Insulin Response, OGTT

DPT-1 Results

- **103,389 screened**
- **339 randomized to Parenteral Trial, 372 to Oral Trial**
- **Parenteral trial showed no benefit**
- **Primary analysis of Oral Trial showed no benefit**
- **Subgroup analysis showed benefit in a group**

DPT-1 Parenteral Study – Time to Diabetes By Treatment

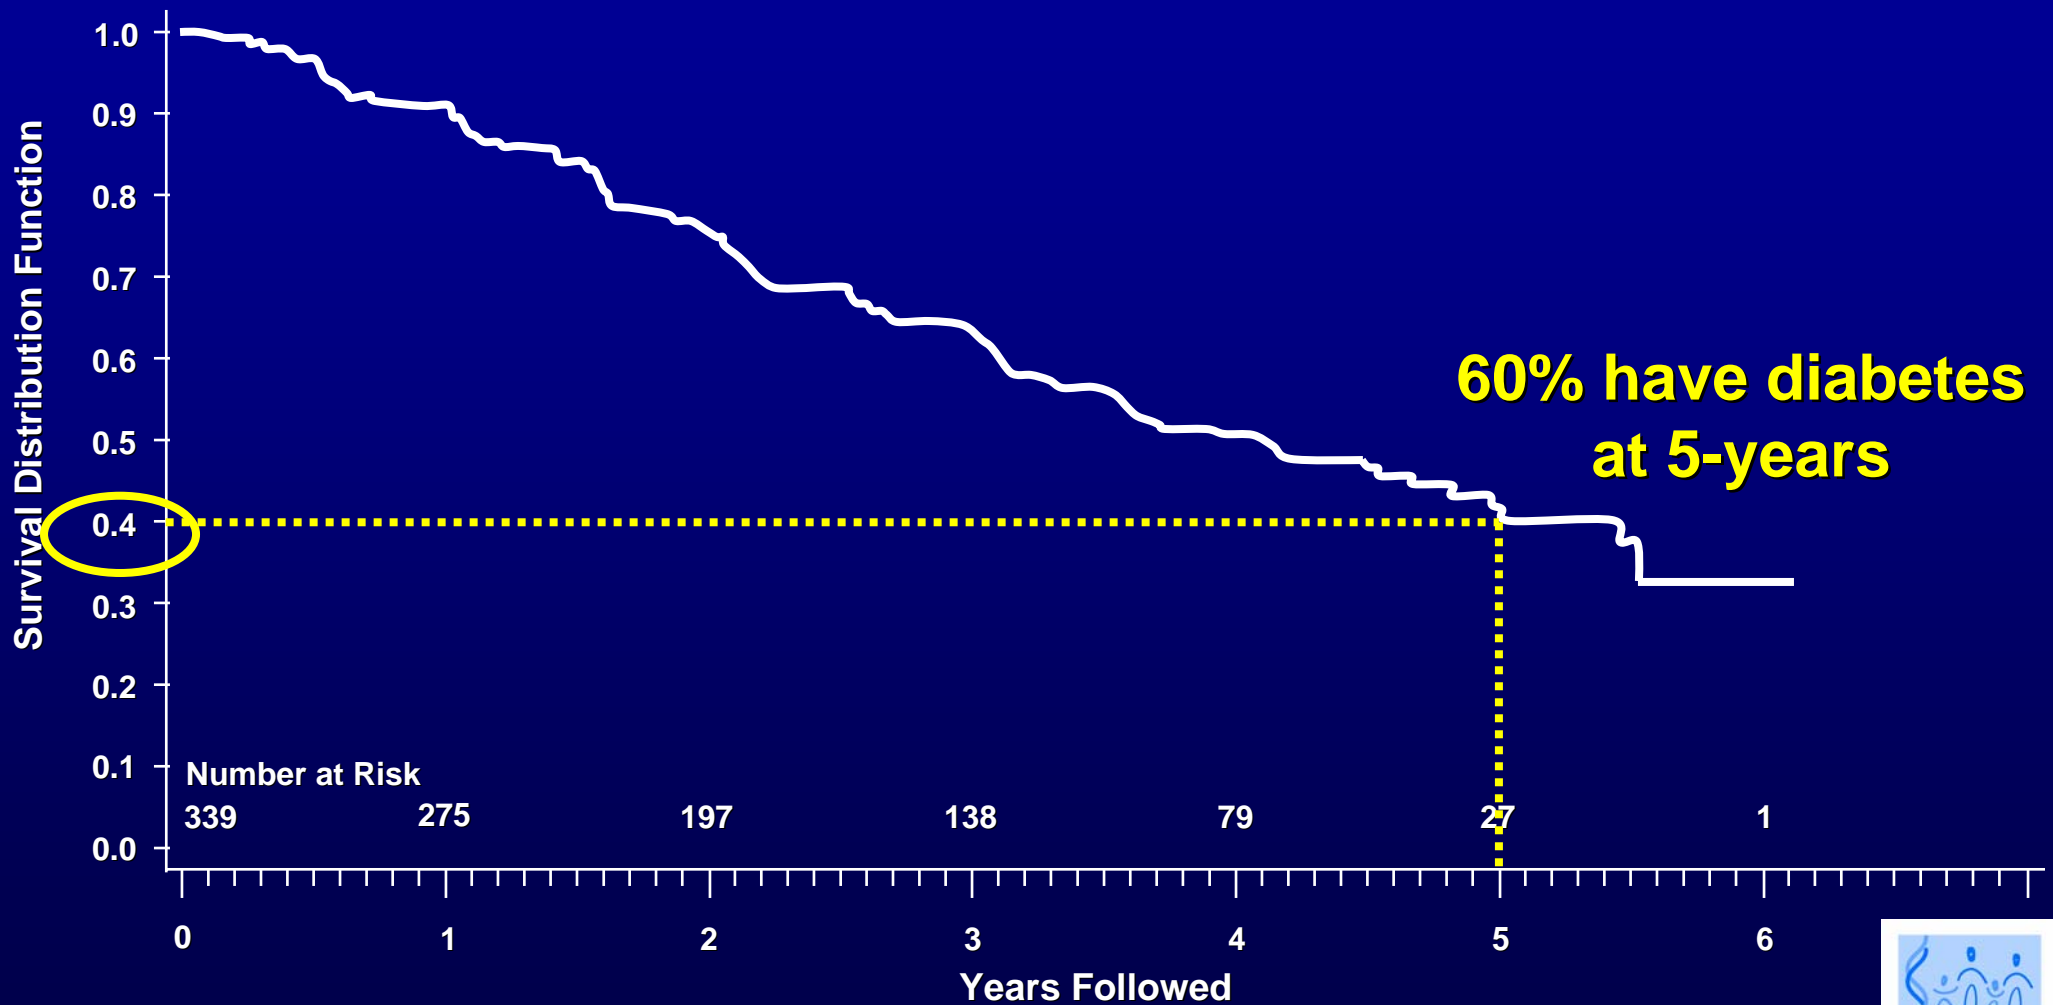

As of April 30, 2001

STRATA: — Intervention — Observation

DPT-1 Parenteral Study – Time to Diabetes

ENDIT

- **Nictinamide or placebo in first degree relatives with islet cell antibody titre >20JDFU**
- **Animal studies and prevention study in New Zealand showed promising results**
- **Conducted in Europe and Canada with few sites in US**

ENDIT Population Screened

Family members screened

~30,000

x 1.2 – 4.5%

Eligible (ICA \geq 20 JDF units)

1004

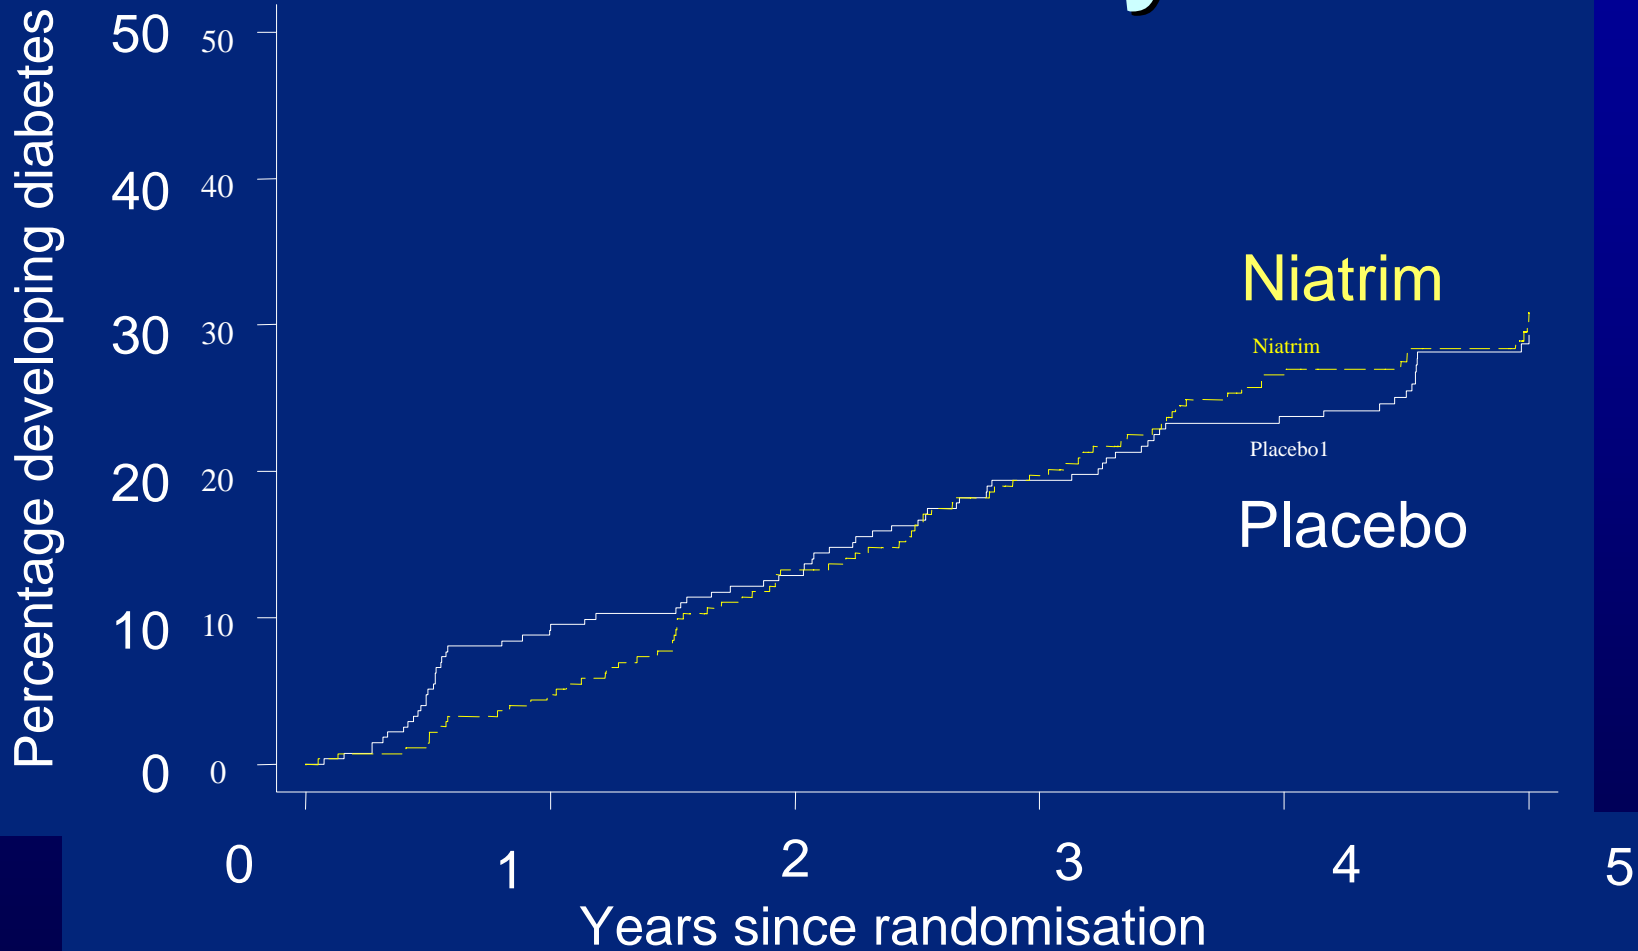

x 55%

Recruited

552

Overall Treatment Effect

Intention to treat analysis

Placebo	275	245	232	205	184	115
Niatrim	274	260	232	208	171	107

Tertiary Prevention

Benefits of New Onset Subjects

- **Subjects easier to find**
- **Shorter studies**
- **Potential benefit to subjects**
- **If efficacious, likely to be so in prevention**
- **Feasibility shown**

Effect of Residual β Cell Function

- 303 of DCCT subjects had C-peptide >0.2 pmol/L at entry
- Intensive therapy prolonged this

<u>Factor</u>	<u>Relative Risk</u>
Retinopathy	0.5
Hypoglycemia	0.38
A1c	Improved over 1 st 4 yrs

Issues in New Onset Studies

- **Defining preservation of C-peptide**
 - Level, change in C-peptide & factors influencing it
- **Effects of diabetes control**
- **Negative effects**
 - Disease acceleration, psychological distress
 - Missing an intervention that only works early in disease course

Tertiary Prevention Therapies

- **Modified anti-CD3 (Herold 2002)**
- **DiaPep277 (Cohen 2001)**

Approaches in New Onset Subjects

- **Modified Anti-CD3 antibody**
- **Tolerance induction in NOD mice, effective at disease onset**
 - **24 subjects & controls**
 - **Median age 13**
 - **14 day course of antibody**
 - **Stable or improved C-peptide at 1 yr in 75% subjects, 17% controls**

Anti-CD3 Effect on C-Peptide

Herold, NEJM 2002

Approaches in New Onset Subjects

- **Antigen based peptide therapy – HSP 277 peptide**
- **Prevents diabetes in NOD, effective at disease onset**
- **35 subjects and controls**
- **Mean age 29.3/23.1**
- **3 injections given at 0, 1 and 6 mons**
- **Stable C-peptide over 10 mons, significantly better than controls**

DiaPep Effect on Stimulated C-Peptide

Cohen, Lancet 2001

Figure 2: **Mean and SD stimulated C-peptide concentrations**
Arrows indicate times of treatment.

**Type 1
Diabetes
TrialNet**

A large, thick red swoosh graphic that starts from the bottom left, curves upwards and to the right, then loops back down and to the left, framing the text on the right side.

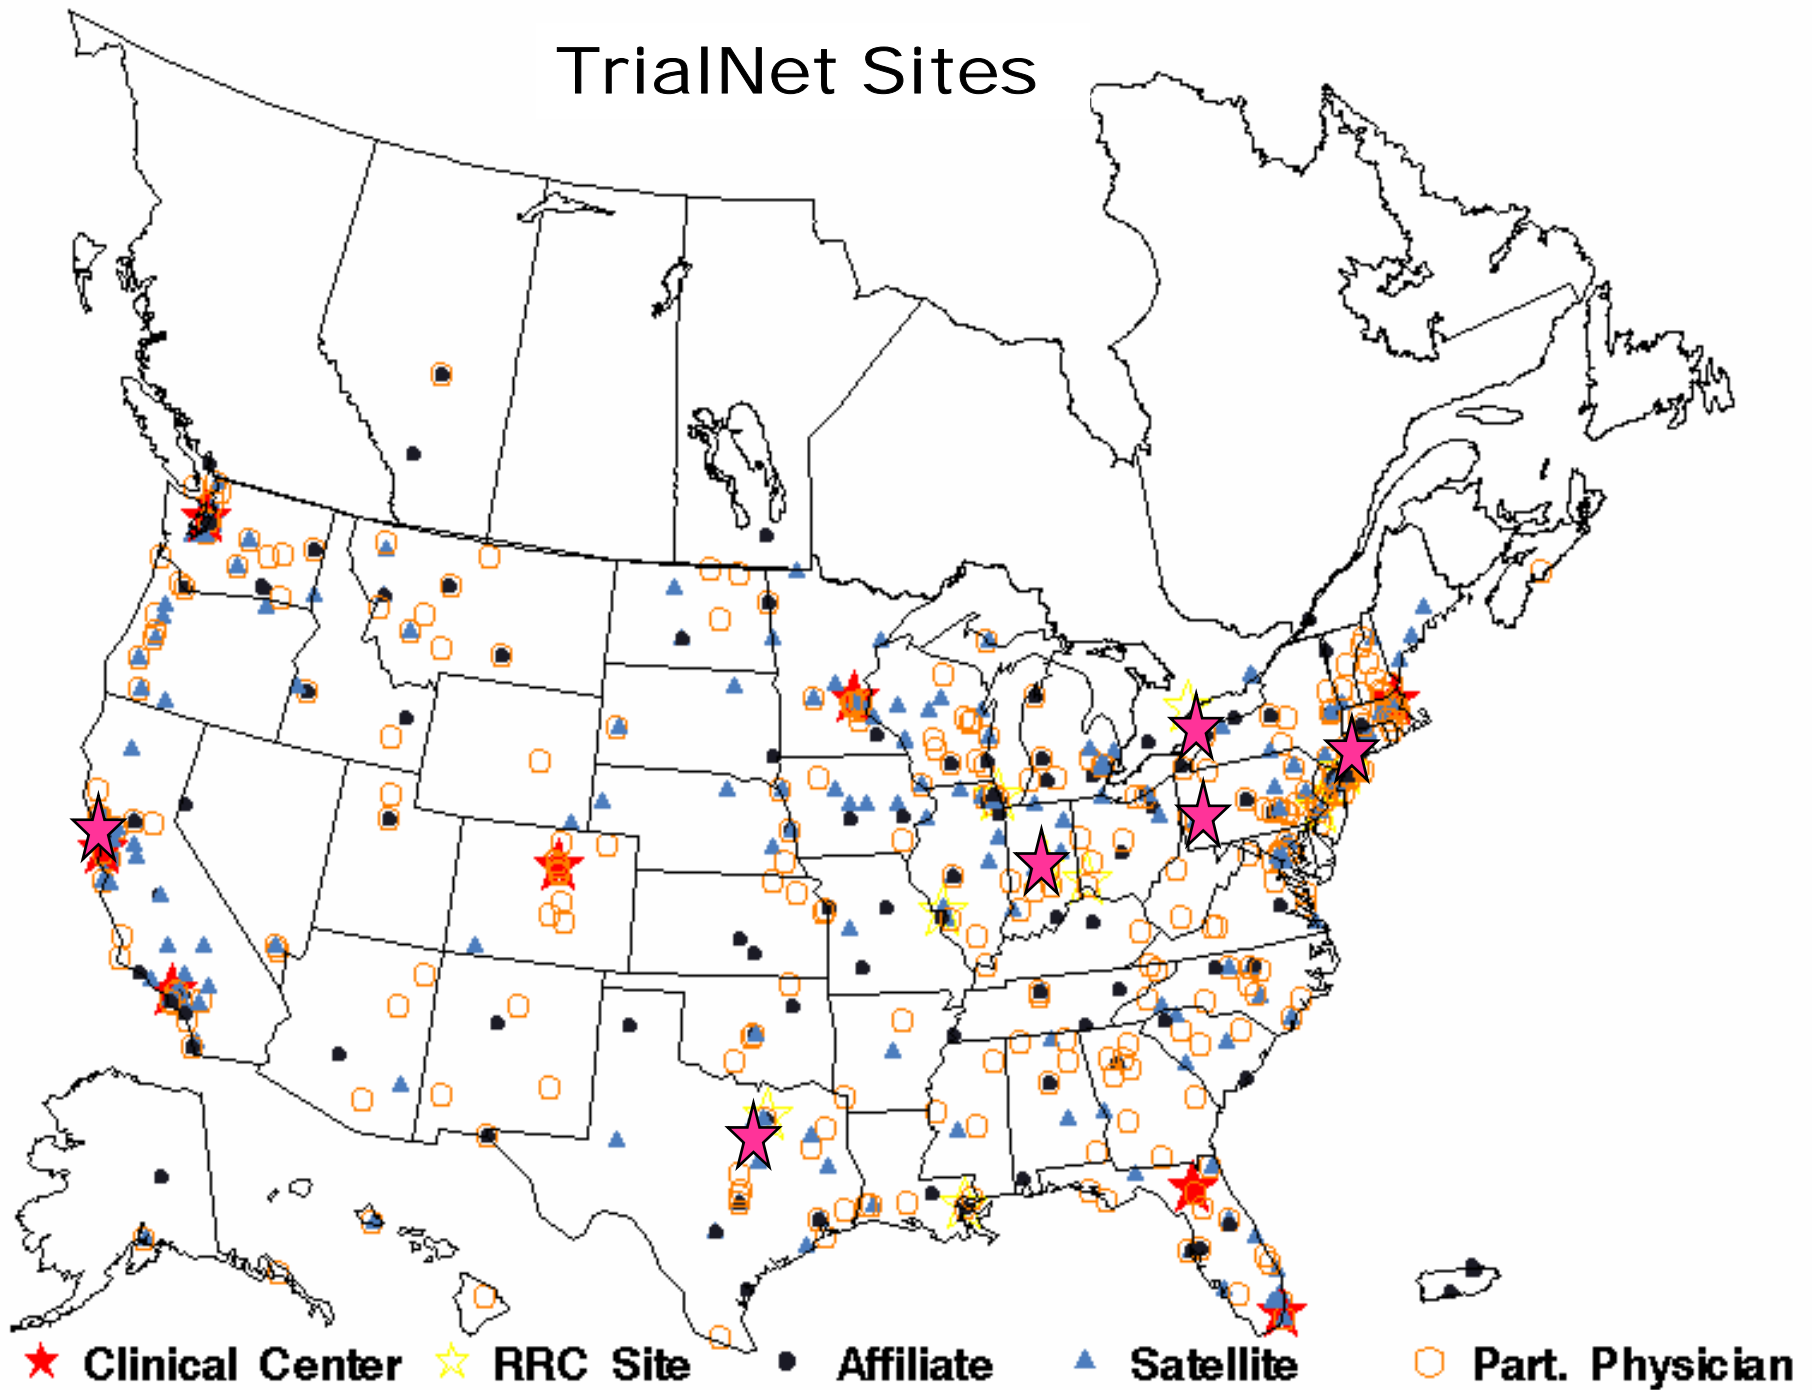

TrialNet Goals

- **Explore new therapies in:**
 - **New-onset type 1 diabetes**
 - **Relatives at risk of type 1 diabetes**
 - **Genetically high risk individuals**
- **Further define epidemiology, natural history, immune mechanisms, genetics and risk factors of type 1 diabetes**

TrialNet Study Group

- **Many DPT-1 investigators**
- **Basic immunologists, transplant physicians/surgeons**
- **Genetics, epidemiology**
- **Enhanced coordinating centre**
- **Link with Immune Tolerance Network for mechanistic studies and trials**

TrialNet Sites

Therapeutic Approaches

- **Newer immunosuppressives**
 - Less toxic, could induce tolerance
- **Antigen based therapies**
 - Peptides or modified proteins
 - Higher doses
- **Diet based**
 - Introduction of solid foods, ?gluten

Active TrialNet Studies

- **Natural History**
- **MMF/DZB**
- **Assessment of Beta Cell Function**
- **Type 1 Diabetes Genetics Consortium**

Natural History Study

- **PURPOSE:**
 - To define how type 1 diabetes progresses prior to diagnosis
 - To identify participants for diabetes prevention trials
- **WHO?**
 - Relatives of those with type 1 diabetes
 - Parents, children, brothers, sisters up to age 45
 - Cousins, grandchildren, nieces, nephews, half siblings up to age 20

Steps In Natural History Study

- **Single blood test to measure diabetes autoantibodies**
- **If found, repeat antibodies and oral glucose tolerance test**
- **Follow-up with same testing every 6 months**
- **1 antibody gives low risk of diabetes, 2 or more 40% risk over 5 years**

Type 1 Diabetes Genetics Consortium

- **Multicentre international effort to recruit 2500 families with 2 members with diabetes, their parents (and an unaffected sibling if possible)**
- **Search for diabetes susceptibility genes**
- **Create resource of DNA and cell lines for researchers worldwide**

Improving Metabolic Assessments in T1DM Clinical Trials (MMTT vs GST)

- In trials of maintenance of insulin production after onset of diabetes, need to measure residual insulin production
- Many methods to test insulin production, but best method is not clear
- Comparing mixed meal (Boost) vs glucagon stimulation

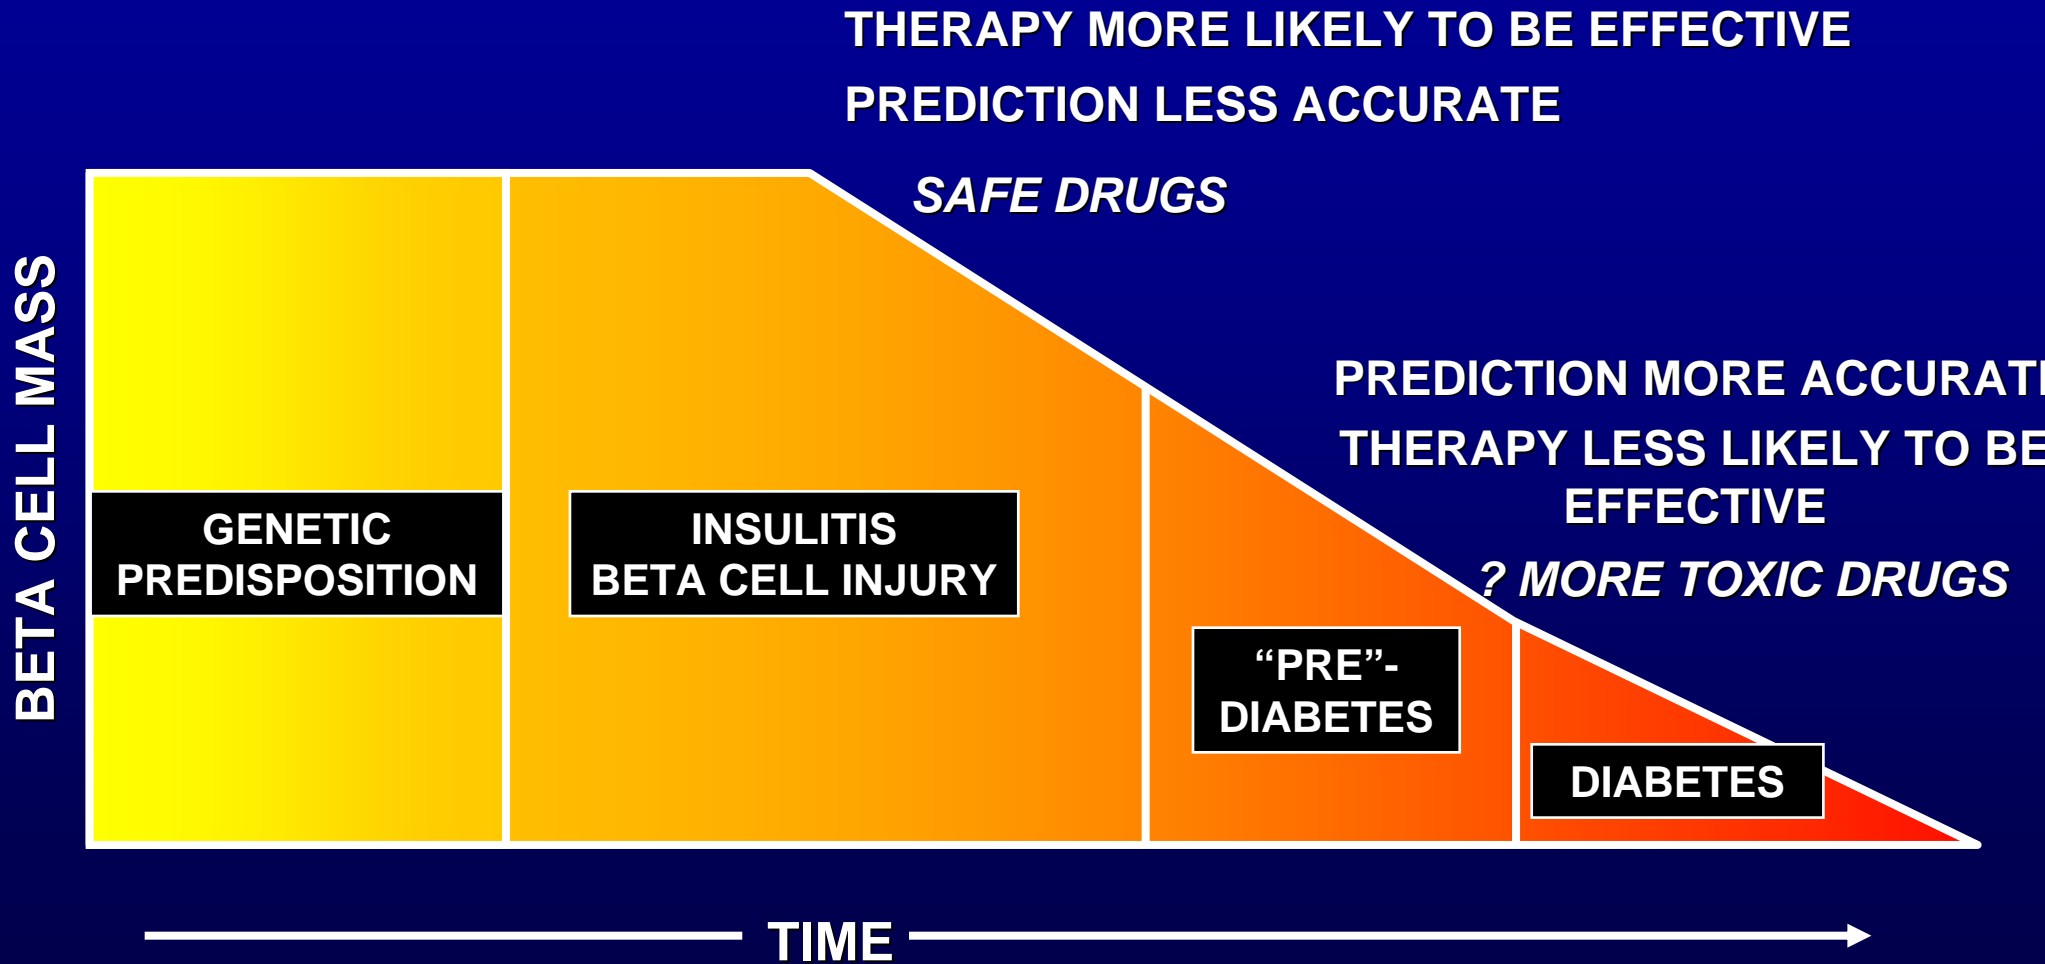

Preservation of Pancreatic Production of Insulin through Immunosuppression – 1

- **Goal:** to maintain insulin production after diabetes onset, using drugs that target active immune response
- **Drugs:**
 - **Diclizamab (DZB)** antibody to CD25, IL-2 receptor expressed on activated T cells
 - **MMF** – interferes with lymphocyte proliferation during an active immune response
- **Not yet started in Canada, running in 6 centres in US**

Interventions Under Consideration

- **Immunosuppression**
 - Anti-CD20
 - Anti-CD3 (Herold)
- **Antigen-Based Therapies**
 - Nasal Insulin
 - GAD
- **Immunomodulation**
 - Anti-CD3
 - IL-2 plus Sirolimus
 - IVIG plus Sirolimus
- **Newborns**
 - Nutritional Intervention: Vitamins D & E, Omega-3-Fatty Acids, Delay of Cereal

Therapeutic Dilemma

Ethical Issues

- **“Attempts to prevent Type 1 diabetes are experimental and should be limited to research studies”, CDA Clinical Practice Guidelines**
- **Newborn screening**
 - **Appropriate consent, harm of labeling**
- **Family members**
 - **Insurance issues, guilt, trials in children**
- **New onset**
 - **“Wishful thinking”, distraction from good control, potential for harm**

Conclusions

- **Prediction improved**
- **Prevention trials unsuccessful to date**
- **Structure established for new prevention trials**
- **Promising new therapies to be tested**
